

friendlyway secure browser[®]

The friendlyway secure browser software provides protection for public workstations against misuse by the users. The product protects the operating system from manipulation, deactivates system key combinations and enables restriction of the search area.

The friendlyway secure browser was developed based on Microsoft Internet Explorer and enables all modern web technologies on your kiosks like simple or complex web pages, scripts and multimedia, as well as customized navigation buttons and user-defined layout.

Moreover, in the new generation of the friendlyway secure browser software there are such functions as secure sending of video, image, and audio e-mails. Optionally, a virtual keyboard can be added for entering address data. The configuration of the friendlyway secure browser is very simple and requires no programming knowledge.

The friendlyway secure browser software is first of all intended for the use in official buildings, universities, schools, hospitals, and tourist facilities, like hotels, conference centers, and restaurants.
